## DS-GA 1013 Mathematical Tools for Data Science

### A \* is born <sup>1</sup>

Let  $x[n]$  and  $y[n]$  with  $n \in \mathbb{Z}$  be two discrete time signals (essentially just think of them as two array of numbers). The convolution between them is a new signal  $y$  defined as  $y := x * h$  given by

$$y[k] := \sum_{k=-\infty}^{\infty} x[k]h[n-k] \quad (1)$$

1. Consider two sequence  $x[n] = [3, 1, 2]$  and  $h[n] = [3, 2, 1]$ . The indexing of both the sequences starts from  $n = 0$ . Find the convolution  $x * h$  by using equation 1. Start by filling in the following table:

$k$	-3	-2	-1	0	1	2	3	4	5	6	$\sum_{k=-\infty}^{\infty} x[k]h[n-k]$
$x[k]$											
$h[-1-k]$											
$h[-k]$											
$h[1-k]$											
$h[2-k]$											
$h[3-k]$											
$h[4-k]$											
$h[5-k]$											
$h[6-k]$											

2. Describe  $h[-k]$  and  $h[n-k]$  for a given  $n$ .
3. Let  $x[n]$  have a width of  $w_x$ , that is it takes indices  $n = 0, \dots, w_x - 1$  and  $h[n]$  have a width of  $w_h$ , i.e it takes indices  $n = 0, \dots, w_h - 1$ . What are the indices that the signal  $y = x * h$  takes and what is the width of the signal?
4. Are the following properties true?
  1.  $x * h = h * x$
  2.  $x * (h_1 + h_2) = x * h_1 + x * h_2$
  3.  $x * (\alpha h) = (\alpha x) * h = \alpha(x * h)$  for some  $\alpha \in \mathbb{R}$
5. Is convolution is a linear operation? If yes, represent represent the operation in question 1 as  $y = Cx$  where  $y$  and  $x$  are vectors and  $C$  is a matrix that will depend on  $h$ .
6. Consider that the signals  $x$  and  $h$  in question 1 are periodic with period  $N = 3$ , that is  $x[n + kN] = x[n]$  for any  $k \in \mathbb{Z}$ . Considering that  $x$  and  $h$  are periodic with  $N = 4$  fill the following table. The convolution between  $x$  and  $h$  considering that they're periodic is called circular convolution.

---

<sup>1</sup>Title shamelessly lifted off from Osgood's book on Fourier transform.

$k$	-3	-2	-1	0	1	2	3	4	5	6	$\sum_{k=-\infty}^{\infty} x[k]h[n-k]$
$x[k]$											
$h[-1-k]$											
$h[-k]$											
$h[1-k]$											
$h[2-k]$											
$h[3-k]$											
$h[4-k]$											
$h[5-k]$											
$h[6-k]$											

- Is the result of circular convolution periodic?
- Write the matrix for circulation convolution matrix like you did in the question before.
- The analogue of equation 1 for the case when the signals are continuous is equation 2. For two continuous signals  $f$  and  $g$ , the convolution between them is defined as

$$(f * g)(t) := \int_{-\infty}^{\infty} f(\tau)g(t - \tau) d\tau. \quad (2)$$

Let  $f(t) = 1$  for  $-1 \leq t \leq 1$ . Find  $f * f$ . Use a compute to see what happens if you keep convolving  $f$  with itself  $f * f * f * \dots$ .

## 2D Convolutions

if  $x$  and  $h$  are discrete 2 dimensional signals, the convolution between them is defined as

$$x(n_1, n_2) * h(n_1, n_2) = \sum_{k_1=-\infty}^{\infty} \sum_{k_2=-\infty}^{\infty} h(k_1, k_2)x(n_1 - k_1, n_2 - k_2)$$

- Describe the action of the following filters to an image:

$$1. \begin{bmatrix} 0 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 0 \end{bmatrix} \quad 2. \begin{bmatrix} -1 & 0 & 1 \\ -1 & 0 & 1 \\ -1 & 0 & 1 \end{bmatrix} \quad 3. \begin{bmatrix} -1 & -1 & -1 \\ 0 & 0 & 0 \\ 1 & 1 & 1 \end{bmatrix} \quad 4. \begin{bmatrix} -1 & 0 & 1 \\ 0 & 0 & 0 \\ 1 & 0 & -1 \end{bmatrix} \quad 5. \begin{bmatrix} 0 & 1 & 0 \\ 1 & -4 & 1 \\ 0 & 1 & 0 \end{bmatrix} \quad 6. \begin{bmatrix} -1 & -1 & -1 \\ -1 & 8 & -1 \\ -1 & -1 & -1 \end{bmatrix}$$

It might be helpful to sum the entries of the following filters when thinking about them:

$$7. \begin{bmatrix} -1 & 0 & 1 \\ -1 & 1 & 1 \\ -1 & 0 & 1 \end{bmatrix} \quad 8. \begin{bmatrix} -1 & -1 & -1 \\ 0 & 1 & 0 \\ 1 & 1 & 1 \end{bmatrix} \quad 9. \begin{bmatrix} -1 & 0 & 1 \\ 0 & 1 & 0 \\ 1 & 0 & -1 \end{bmatrix} \quad 10. \begin{bmatrix} 0 & 1 & 0 \\ 1 & 5 & 1 \\ 0 & 1 & 0 \end{bmatrix} \quad 11. \begin{bmatrix} -1 & -1 & -1 \\ -1 & 9 & -1 \\ -1 & -1 & -1 \end{bmatrix}$$

$$12. \frac{1}{9} \begin{bmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \\ 1 & 1 & 1 \end{bmatrix} \quad 13. \frac{1}{16} \begin{bmatrix} 1 & 2 & 1 \\ 2 & 4 & 2 \\ 1 & 2 & 1 \end{bmatrix}$$
